INSTALLATION GUIDELINES

IMPORTANT INSTALLATION GUIDELINES

- Choose qualified personnel who is familiar with the STEP heating system.
- This is an electric heating system and requires trained personnel in the National Electrical Code that understands the importance of preventing mistakes that can cause an electrical fire.
- The installation shall be made in accordance with local codes, ordinances, trade practices, and manufacturers' instructions.
- Make sure that all materials used are approved for the specific application and have no adverse compatibility with the heating elements.
- Use only components recommended by the manufacturer.
- Read and follow the installation instructions to assure having the best satisfaction for a comfortable and energy efficient heating system.

STEP WARMFLOOR™ HEATING SYSTEM

- STEP Warmfloor™ is a flat, flexible and thin heating element.
- The heating element can be cut to length at the jobsite.
- The element can be stapled/nailed without affecting the conductivity (just avoid penetrating the two conductors on each side).
- The element can easily be bent 90 degrees to fit any contour.
- The element is strong and has no failure rate during installation.
- STEP Warmfloor™ can be used under almost any flooring including tile, stone, wood, laminate, resilient and carpet.
- The system is ideal for both renovation and new construction.
- No room is too small or too large to be heated with this system.
- Because the product is thin, 3/64” (1.2mm), it can be installed without changing the height of molding, doors or cabinets.
- The system is designed to simplify the individual control of each room.
- STEP Warmfloor™ has the ability to self-regulate - as the material gets warmer, less electricity passes through the plastic - therefore it is extremely energy-efficient.
- The element acts on its whole surface as a sensor and cannot overheat.
- This unique Nano technology has been around for 30 years.
- This heating system is very versatile and can be used for residential, commercial and industrial applications. From taking away the chill of cold floors to keeping free of ice and snow driveways and more
- If it needs heating STEP Warmfloor™ has the solution.
**BEFORE STARTING**

**DESIGN AND CALCULATIONS**

- The installation shall be calculated and a layout made to determine the materials required.
- The more specific the layout the easier will be the installation. Indicate for each area:
  - Exact room measurements and fixed fittings.
  - Placement and number of strips of elements.
  - Length and wattage per element strip.
  - Location of power source, including control and power supply(s).
  - If required, location of electrical box and terminal block(s).
  - Wire size and length according to load and distance to the power source.
  - Size of power supply and load distribution on the interface board.

**FLOOR SURFACE AND INSULATION**

- For energy efficiency, thermal insulation is required under the heating elements. Remember that hot goes to cold, equally in all directions.
- The heating elements can be installed on any dry, clean, non-conductive, and structurally sound surface.
- Floor temperature should be at least 65°F (18°C) when installing the elements.

**REQUIRED TOOLS**

- STEP crimp tool
- Utility knife or scissors
- Wire stripper
- Screw driver
- Multi-meter (clamp meter preferred)
DESIGN AND CALCULATION

HEATING NEEDS

Decide on the application of the floor heating system before starting design and calculations. The calculations should take into considerations:

- Heating required; primary heat, complementary heat, or floor warming
- Outside average temperature, insulation values, room size
- Additions and conservatories may need to be calculated according to usage and construction.

FLOOR WARMING

Floor warming systems take the chill out of cold floors, but are not designed to be the primary heat source. Typically a floor warming system is installed in the bathroom and underneath tiles in the kitchen, hallway or other areas where you want the comfort of under floor heating. When used as a complementary heat source it shall provide a gentle and even under floor heating experience in addition to the existing heating system in the house.

- For floor warming evaluate the needs for each area: room type; available open floor space and floor covering.
- Bathrooms may require more heat and this can be achieved by selecting heating elements with a higher wattage or placing elements under tubs or shower pans, in walls or behind mirrors.
- Use a floor sensor to avoid competing thermostats from other heat sources.

PRIMARY HEATING

For primary heating a heat loss calculation is required. This can be done per room or for the whole house. STEP Warmfloor™ provides services for project specific heat loss calculations.

- Perform a heat loss calculation to identify the wattage needed to heat the area to the required temperature in your location.
- You will need to know the type of construction, the measurements and insulation values of the floor, walls (including windows and doors) and ceiling.
- Design the spacing between the elements and/or use an element type with higher wattage to get the necessary wattage.

NOTE: Floor surface temperature should not exceed 85°F (29°C)
DESIGN AND CALCULATION

LAYOUT AND DESIGN

RECOMMENDED SPACING
Maximum recommended spacing between strips of elements:

<table>
<thead>
<tr>
<th>Material</th>
<th>Minimum Spacing</th>
<th>Maximum Spacing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ceramic tile, natural stone, resilient</td>
<td>2 - 3 inches</td>
<td>5 - 7.5 cm</td>
</tr>
<tr>
<td>Hardwood, laminate</td>
<td>2 - 5 inches</td>
<td>5 - 13 cm</td>
</tr>
<tr>
<td>Carpet</td>
<td>2 - 8 inches</td>
<td>5 - 20 cm</td>
</tr>
</tbody>
</table>

Where the heating needs are less than 3.5 W/sqft. (38 W/m²), plan the distribution so that the strips of elements do not exceed the recommended spacing to avoid uneven temperatures (i.e., cold spots between the strips of elements).

ROOM LAYOUT AND ELEMENT STRIPS
Measure the room(s) and create a drawing of the area to be heated. Make sure to draw in any fixed fixtures and other areas where heating is not to be installed.

Position elements, thermostat and power supplies

Position the elements in the most convenient direction to have as few strips as possible taking in consideration where the wires will be connected.

1) Make sure to place elements close, in front of the vanity, tub and toilette.
2) In narrow areas where the distance between the strips is more than the recommended spacing consider:
   a. changing direction of the elements
   b. adding more distance between the wall and the first element
   c. using 9” wide elements
3) Indicate number and length of each strip.
4) Position the thermostat on an interior wall away from windows, doors and other areas with draft.
5) The power supply must be installed in a well-ventilated area in accordance with Article 450 of the National Electric Code. Provide sufficient clearance for free flow of air to allow adequate cooling and to eliminate fire hazard. Keep delicate and flammable materials away from the power supply enclosure.

NOTE: Make sure to always place element strips perpendicular to hardwood and engineered floors.
DESIGN AND CALCULATION

ELEMENT TYPE AND WATTAGE
The default heating element for floor warming projects and most primary heating projects is EP-30-2-24W (STEP Residential™). Installing heating elements with substantially higher wattage than needed will make the system more reliant on a thermostat and thereby decrease energy efficiency.

Choose the appropriate heating element according to the heating needs, available open floor space to be heated and floor covering.

Table: Element type and wattage
* Floor covering limited to concrete, tile or stone

ELEMENT LENGTH AND WATTAGE PER POWER SUPPLY
The EPI-LX and EPI-LXR power supply series consist of one to three 500 watts circuits.

Designed wattage is 90% or 450 watts.

1) Do not exceed the maximum length @ 450W for the selected element in table “Element type and wattage”

2) Combine element strips from the layout to optimize distribution for each 450 watt circuit in the power supply.

**DESIGN AND CALCULATION**

**WIRE GAUGE AND TERMINAL BLOCK USAGE**

Minimize voltage drop by planning the wire runs as short as possible. Use larger wire gauge for more power output.

Refer to the following chart for maximum secondary wire length, both wires included, per circuit in feet.

<table>

</tbody>
</table>

To avoid increasing the height on the floor, use wires 14 AWG or 12 AWG. The maximum wire gauge on the connectors to the elements is 10 AWG.

If the power supplies are not close to the elements, instead of using larger wire size in the floor, or running too many or too long wires across the room, the elements can be connected to terminal blocks.

Keep each terminal block to maximum 450W and then calculate the appropriate wire size used to run to the power supply.

CONTROL AND THERMOSTAT OPTIONS

The STEP Warmfloor™ heating elements are self-regulating and therefore act as a sensor over the whole floor surface. Although the heating system does not require a control unit, except for an on/off switch, it is highly recommended to install a thermostat.

To ensure long life and maximum efficiency, use only recommended controls for the EPI-LX / -LX-R power supply series.

24 VOLTS THERMOSTAT

The EPI-LX-THPR, programmable, and the EPI-LX-TH, non-programmable, thermostats can be used in conjunction with all the EPI-LX-R power supply series.

- Install the thermostat on an interior wall and away from the sun rays and drafts.
- Measure the distance from the power supply to the thermostat to identify the length of the thermostat wire.

The low-voltage (24V) thermostat is connected to the power supply using a 3-conductor cable and can control up to 20 power supplies.

The controllers have three temperature control modes:

A mode: ► controls and displays the ambient air temperature
F mode: ► controls and displays the floor temperature using an external temperature sensor (EPI-LX-SEN)
AF mode: ► controls and displays the ambient and floor temperature within desired limits using an external temperature sensor.

The EPI-LX-TH /-THPR thermostat maximizes the efficiency of the STEP Warmfloor™ system by requiring the heating elements to gently replace only the heat that is lost from the zone. Temperature is measured in 15 minutes cycles by the thermostat's microprocessor, which determines the amount of pulsing needed for each subsequent interval.

Floor Sensor

When installing complementary heating or floor warming use a floor sensor to avoid the thermostat from competing with thermostats from other heat sources. The floor sensor is installed in the floor and should not touch the elements.

120 VOLTS TIMER SWITCH

The MICRO-PROG is a programmable timer switch that can be used with the EPI-LX or EPI-LX-R-250W / 500W and 1000W models. The control is connected to 120V and has 2 operating modes, manual (MAN) and automatic (AUTO).

This controller is normally only used for small areas.
Electric Radiant Heating Equipment Operating at 30 Volts or Less

General

1. Scope. This installation instruction covers electric equipment and associated components operating at 30 volts or less for indoor and outdoor use. For the purpose of this manual heating equipment shall include heating elements, unit heaters and power supplies.

2. Definition. Heating Systems Operating at 24 Volts. A complete heating system consisting of components such as low-voltage isolating power supplies and heating elements, including associated components that are all identified for the use. The output circuits of the power supply are rated for not more than 25 amperes and operate at 30 volts or less under all load conditions (SELV – Safety Extra Low Voltage).

3. Listing Required. Heating systems operating at 24 volts shall comply with (A) and (B).

   (A) Listed System. Heating systems operating at 30 volts or less shall be listed as a complete system. The heating elements, power supply and fittings shall be listed for the use as part of the same identified heating system.

   (B) Assembly of Listed Parts. The listed system and approved system components shall be installed in accordance with the manufacturer’s instructions.

4. Specific Location Requirements. Floors, Walls, and Ceilings.

   (A) Extension wires (non-heating leads) from the heating elements can be routed on the subfloor to the wall provided they do not cross one another in the floor.

   (B) Conductors extended through a wall or ceiling shall be in accordance with NEC Chapter 3. Wires shall be run in conduits through building structure.

5. Secondary Circuits.

   (A) Grounding. Secondary circuits shall not be grounded.

   (B) Isolation. The secondary circuit shall be insulated from the branch circuit by an isolating transformer.

(A) Electric Radiant Heating Panels and Heating Panel Sets. Installation shall be made in accordance with NEC 424.90 through 424.99 with the following exceptions on 424.93 (B) (3) and 424.99 (C) (5) described in (a) and (b) respectively:

a. PTC Polymer Heating Panel Sets. Nailing or stapling of PTC polymer heating panel sets shall be done through the polymer material but at least 6mm (1/4 Inch) from the bus conductors. Nails, staples or other fasteners shall not penetrate the current-carrying bus conductors.

b. Fault Protection. A device to open all ungrounded conductors supplying the heating panel sets, provided by the manufacturer shall function when short circuit occurs, such as a result of penetration of both bus conductors or extension wires with a metal device.

(B) Fixed Outdoor Electric Deicing and Snow-Melting Equipment. Installation shall be made in accordance with NEC Article 426 with the exceptions of grounding and ground-fault protection requirements described under 426.22, 426.27 and 426.28. Secondary circuit shall not be grounded according to E.5 (A).
FLOORING INSTALLATION OPTIONS

TILE – IN THIN-SET

WOOD – NAIL DOWN OR FLOATING FLOORS

CARPET – STRETCH-IN

BETWEEN JOISTS – UNDER SUBFLOOR

View more flooring options and guidelines at www.warmfloor.com
**INSTALLATION**

**STEP 1 - POSITIONING THE ELEMENTS**

**NOTE:** The elements are held down to the subfloor with cement based mortar, latex modified thin-set, staples, or approved tape. Do not use duct tapes, adhesives or premix products, unless they are approved by the manufacturer to be compatible with the heating elements.

- The heating element comes in a roll. Cut the element with a pair of scissors to the desired length. The maximum load per strip of element is 450 watts. Refer to Design and Calculation.
- To avoid having a voltage drop at the end of the element strip, the recommend wattage is 225W; e.g. for element EP-30-2-24W, the length would be 28.5 feet. The length can be extended to 57 feet by connecting both ends of the element strip. Refer to Fail Safe Wiring.
- It is important to follow the layout and worksheets provided with the heating system. Should changes be made, it is important to recalculate the element length and load distribution on the power supply.
- The elements shall be placed in open spaces and not underneath fixed fittings; such as bookshelves, cupboards, cabinets, etc.
- Minimum distance between elements and from plumbing fixtures is 2 inches (5 cm).
- Position elements in critical places, e.g., in front of the vanity (including toe-kick), the tub or shower and the toilet bowl.
- Choose where the wires will be connected and leave adequate spacing to route them.
**INSTALLATION**

- The extension wires can be connected on the floor, up the wall under the baseboard, or in raised foundation, under the subfloor.

- Stretch the element in position. The elements must lay flat with no air gap.

- Anchor the elements to the subfloor using staples, plastic pegs or approved tape, secure on one end, stretch, hold, and then secure the other end.

- When securing the elements onto the floor, definitely avoid the bus braids on each side of the element.

- Connect the wires to the elements.
**INSTALLATION**

**STEP 2 - CONNECTING THE WIRES TO THE ELEMENT**

- **Expose the bus braids** by making an angled score in the plastic, front and back and along the bus braid above the score, with a utility knife. Bend the element where the cuts are made and pull off the corners to remove the surplus of plastic. **Make sure that the bus braid is not cut or damaged.** Should this occur, re-cut the element and re-strip the bus braid. Repeat on the other side.

![Utility Knife](image)

- **Connect the bus braid to an extension wire**, (PVC insulated, stranded tinned copper wire, 105°C, 300V). Refer to Wire Gauge chart. Crimp the joint using the recommended tinned copper connectors and crimp tool. Using components not recommended by the manufacturer will void the warranty.

![Crimp Tool](image)

- **To differentiate the polarities supplied to the element**, use two different wire colors (e.g., black and white) and number them for future reference. Insulate the connections using the recommended sealant tape. Fold tape and press together overlapping element, connector and wire to form a flat and smooth splice.

![Sealant Tape](image)

**IMPORTANT:** Check that connections are secure.
**INSTALLATION**

**STEP 3 – ROUTING THE WIRES**

**IMPORTANT:** The installation shall be made in accordance to local codes and ordinances. Codes may require special wiring and/or a conduit (plastic or metal) in the walls.

- Plan circuit supply from main panel to on/off switch, control, power supply, terminal block (if needed), and heating elements. Refer to Wiring Diagram, Power Supply Capacity, and Wire Size.
- Power Supply shall be placed vertical on a wall, in the ceiling, under the floor or in a closet, according to NEC code in such a way that heat is dissipated effectively. Make sure that vibration is not transmitted through the wall or structure.
**INSTALLATION**

**WIRING OPTIONS**

**IMPORTANT:** Refer to Wire Gauge Chart to minimize voltage drop.

(1) When running the wires on the floor, route them neatly and do not allow them to cross one another. Where appropriate, make a groove in the floor to protect and bury the wires. Connections and wires can also run under the floor between joists.

(2) Elements may be linked as long as the added total length does not exceed 450W.

(3) In some applications, fail safe wiring may be required.

(4) Terminal block(s) may be needed if the power supply is located away from the elements, as this allows using larger wire gauge to minimize voltage drop. Connect all the hot (black) wires to one bus-bar and all the neutral (white) wires to the other bus-bar. Maximum total load per terminal block is 450 watts.

(5) The elements can be routed and connected directly to the interface board on the power supply. Distribute evenly the load from the elements to each circuit breaker.
FAIL SAFE WIRING

The fail safe method is recommended for installations that are not embedded in concrete, mortar, leveling compound or under underlayment and cement boards, e.g., under carpet and carpet cushion, under the subfloor between joists, in walls, behind mirrors, etc.

Fail safe wiring is used wherever there may be a risk of cutting or damaging the bus braids. This method avoids creating a short.

Fail safe wiring can also be used to avoid a voltage drop when installing long element strips.

The heating elements can be routed directly to the power supply or if needed to a terminal block.

All wires to the elements in the floor must be PVC insulated, stranded tinned copper, minimum #14AWG (2mm²)
INSTALLATION

STEP 4 – CONNECTING THE ELEMENTS TO THE POWER SUPPLY

- Each room can have one or more power supplies and if necessary multiple terminal blocks.
- The maximum wattage, on the secondary side, per circuit breaker in the interface board of the power supply is 450 watts (or 18.75 amps on 24V). For example, power supply EPI-LX-R-500VA has one circuit breaker with a maximum load of 450W; power supply EPI-LX-R-1000VA has two circuit breakers, thereby two times 450W; and power supply EPI-LX-R-1500VA has three circuit breakers; thereby three times 450W.
- Minimize voltage drop by planning wire runs as short as possible from elements to power supply. See Wire Gauge Chart for wire size and length versus load.
- If the power supplies are not close to the elements, instead of using larger wire size in the floor, or running too many or too long wires across the room, the elements can be connected to terminal blocks. Keep each terminal block to maximum 450W and then calculate the appropriate wire size used to run to the power supply.
- Always connect elements in parallel - not in series. Connect same polarity wires together and number each element with its corresponding hot (positive) and common (neutral) wires to facilitate further measurements.
- **IMPORTANT**: A certified electrician has to measure the amperage for each heating element BEFORE being covered and the values have to be entered on the Check List form. For guidance, refer to Design & Calculation.
- Select the 24-Volt power supply(s) that has the capacity to satisfy the load of heating elements installed. Maximum load on the power supply is 90% of its total capacity. For data sheet specifications, see Low-voltage Power Supply.
- The power supply must be installed in a well-ventilated area in accordance with Article 450 of the National Electric Code. Provide sufficient clearance for free flow of air to allow adequate cooling and to eliminate fire hazard. Keep delicate and flammable materials away from the power supply enclosure.
- Choose the appropriate control for the application. For data sheet specifications, see Control Options.
- **STEP Warmfloor™** Labels shall be provided with the heating product. The following labels should be filled out and affixed in the place indicated:
  - Serial Number label comes on the box and/or on the element and on the power supply.
  - The element and the transformer come with a printed or labeled ETL logo.
  - Caution label is to be attached to the junction box.
  - Warning label is to be attached to the service panel.
- For the warranty to be valid refer to Terms and Conditions of Sale and Warranty Registration.
- **NOTE**: Leave a copy of all documents referring to the installation of **STEP Warmfloor™** in the service panel at the job site.
STEP 5 – CONNECTING THE POWER SUPPLY AND CONTROLS

1 Up to 20 EPL-LX-R power supplies can be connected to one EPL-LX-TH/THPR thermostat.
2 Terminals marked with an "L" can be used as neutral terminals. For certain areas, NEC requires AFCI circuit breakers on 120 volt systems. To simplify wiring and circuit breakers, use 220 volts.

Floor Temperature Control Mode (Optional)

NOTE: The EPL-LX-SEN floor sensor should be connected between the terminals labeled "24H" and "SEN" on the EPL-LX-TH/THPR thermostat. Two conductors will share the "0V" terminal on the EPL-LX-TH/THPR thermostat.

Positioning

Center the EPL-LX-SEN floor sensor between two floor heating elements for best temperature control and measurement. Make sure the sensor cable does not come in contact with the heating elements. Do NOT staple the sensor head (the plastic end) to the floor. Doing so may damage the sensor. Any damage to the sensor may not be noticeable initially but can become apparent several days later.

Alternative Positioning

Run the sensor cable through an electrical PVC conduit in the wall cavity (where the EPL-LX-TH/THPR thermostat is mounted), and route it down to the sole plate in a place most representative of the zone being heated. The end of the conduit should be placed in such a way so that the sensor head makes contact with the sole plate.
INSTALLATION

WIRING DIAGRAM FOR THE PCB INTERFACE BOARD

Distribute evenly the load from the elements to each terminal on the secondary circuit breaker. Each terminal can take the following number of wires according to wire gauge:

<table>
<thead>
<tr>
<th>Wire Gauge</th>
<th>14 AWG</th>
<th>12 AWG</th>
<th>10 AWG</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>3</td>
<td>2</td>
<td>1</td>
</tr>
</tbody>
</table>

**NOTE:** Use only stranded wires in the PCB terminals. Insert wires in a straight (rather than twisted fashion for best contact).

**WARNING:** Electronics are delicate devices; do not twist or force the terminals and use proper tools to tighten the screws. Tighten with 7 in/Lbf (inch pound force) or 0.8 Nm torque.

PCB EPI-110 and EPI-100 come with one (1) resettable circuit breaker on the primary.

<table>
<thead>
<tr>

</table>
24 VOLTS THERMOSTAT

Use a 3-conductor signal wire (red, green and black) from the PBC EPI-200 to the thermostat.

- Up to 20 power supplies can be connected to one control unit with a turn on delay of 1.5 seconds between each power supply.

The thermostat can be used to control the ambient air temperature and/or the floor temperature.

**NOTE:** To control the floor temperature a floor sensor is required and has to be installed in the floor between and away from the heating element.

As an option for small areas, a line voltage timer switch can control the power supply. Refer to Wiring Diagram for PCB Interface Board.

If a 120V line voltage timer switch is going to be used, bypass the thermostatic control by placing a shunt wire between the terminals marked (TRG) and (24~) on the PCB EPI-200.

Switching can also be implemented between these two terminals.
STEP 5 – CONNECTING TO THE POWER SUPPLY AND CONTROL

**NOTE:** The EPI-LX-GEN floor sensor should be connected between the terminals labeled "24V" and "S" on the EPI-LX-TH/THPR thermostat. Two conductors will share the "24" terminal on the EPI-LX-TH/THPR thermostat.

1. Up to 20 EPI-LX-R power supplies can be connected to one EPI-LX-TH/THPR thermostat.
2. Terminals marked with an "L" can be used as neutral terminals. For certain areas, NEC requires AFCI circuit breakers on 120 volt systems. To simplify wiring and circuit breakers, use 230 volts.

**Positioning**
- Center the EPI-LX-GEN floor sensor between two floor heating elements for best temperature control and measurement. Make sure the sensor cable does not come in contact with the heating elements. Do not staple the sensor head (the plastic end) to the floor. Doing so may damage the sensor. Any damage to the sensor may not be noticeable initially but can become apparent several days later.
- **Alternative Positioning**
  - Run the sensor cable though an electrical PVC conduit in the wall cavity (where the EPI-LX-TH/THPR thermostat is mounted) and route it down to the sole plate in a place most representative of the zone being heated. The end of the conduit should be placed in such a way so that the sensor head makes contact with the sole plate.
INSTALLATION

STEP 6 – LEVELING AND COVERING THE FLOOR

- Level the floor in accordance with the trade and the manufacturer's instructions, using mortar, mud bed, building boards, underlayment panels, etc. **Do not use adhesives or non approved tapes in direct contact with the elements.**
- Codes are revised; new products enter the market and material composition change constantly. It is therefore important to know if these changes comply and/or are compatible with the application.
- Check with the leveling compound and/or building board manufacturer to assure that the material used is appropriate for the given installation.
- To be efficient the heating elements have to be in direct contact with the finished flooring, with no air gaps.
- It is strongly recommended to have thermal insulation under the heating elements.
- Do not place a conductive material in direct contact with the heating elements, i.e., metal mesh, aluminum foil, etc.
- In bathrooms, showers and wet areas, the heating elements shall be installed under a waterproof membrane.
- Respect curing time for concrete, setting materials, grouts, and adhesives.
- To condition the site and acclimatize certain floor coverings, it may be necessary to turn the heating system on. Start with a low heat, and progressively raise the supply temperature until it reaches its maximum temperature.
- The first time the system is switched on; it may take some time until the floor gets to the desired temperature.
WARRANTY REGISTRATION AND COVERAGE

LIMITED WARRANTY:

Electro Plastics’ limited warranty is valid from date of original purchase, as follows (not included in this warranty are OEM and specialty products):

- 20 years for the STEP Warmfloor Heating Elements.
- 10 years for the STEP Snowmelt Heating Elements.
- 10 years for the STEP Transformer Coils in the Power Supplies.
- 2 years for the Interface Electronics in the Power Supplies.
- 2 years for the STEP Controls

Electro Plastics sole obligation under its warranty shall be, at its option, to either issue a credit for the purchase price, or repair or replace any article or part thereof, which is proved to be other than as warranted.

For this warranty to be valid, a copy of the STEP Labels shall be delivered to ELECTRO PLASTICS, INC., with a diagram indicating to which branch circuit the system is connected, the location of the element strips, the routing of the wires and their different measurements, voltage, amperage, elements and wire length.

Electro Plastics warrants the products to be free from defects in material or manufacturing and to perform under normal use. For the warranty to be valid, qualified personnel who are familiar with the construction and operation of the system must install the equipment and a certified electrician has to verify and measure the STEP elements BEFORE they are covered.

Exclusions

Electro Plastics shall not be responsible for any loss or damage that may arise due to:

- Non-compliance with installation and/or usage of the STEP elements and accessories as recommended. It shall be Buyer’s and End User’s duty to read and follow carefully the STEP Installation Manual. Technical assistance services, e.g. design and layout are to be used as GUIDELINES ONLY, as each application is specific to local conditions and construction
- Dissatisfaction due to improper Installation of the floor covering. All floor covering shall be installed in conformance with the manufacturer's instructions and shall conform to all applicable trade practices, local codes and manufacturer's specifications.
- Usage of inadequate or non-specified materials with the STEP heating system or products.
- Any and all defects, deficiencies or failures resulting from improper handling of the product; e.g., cuts made to the STEP elements, or the wires, etc.
- Tampering with the STEP heating system or products; e.g., removing, altering or overloading the circuit breakers, overcurrent protectors, etc.
- Installation of merchandise with obvious visible defects.

How to claim this warranty

In order to obtain warranty service, Buyer shall return the unit to the dealer from whom the unit was originally purchased, with a dated sales receipt. The dealer will forward the unit to Electro Plastics. Upon receipt of the defective unit, paperwork and explanation of application, Electro Plastics will inspect and test the unit in order to determine the reason for the alleged failure. If it is determined that the unit was properly installed and failed during normal use, as a result of a manufacturing defect, Electro Plastic will repair or replace the unit, or issue a credit or refund of the purchase price, at its sole discretion. The warranty period for any replacement unit will fulfill the warranty of the original unit and will not be extended.
WARRANTY REGISTRATION AND COVERAGE (CONTINUED)

Limitations
Under no circumstances will Electro Plastics be liable for labor or other charges related to the installation and use of the STEP heating system or products. This warranty does not cover labor or removal or reinstallation of the product and is void on any product installed improperly, or in an improper environment, overloaded, misused, abused or altered in any manner. THE WARRANTIES STATED HEREIN ARE EXCLUSIVE OF ALL OTHER WARRANTIES, WRITTEN OR ORAL, STATUTORY EXPRESS OR IMPLIED, INCLUDING ANY WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, NONE OF WHICH SHALL APPLY TO THE SALE OF THE COMPANY’S PRODUCTS HEREUNDER. THIS WARRANTY ALSO EXCLUDES INCIDENTAL OR CONSEQUENTIAL DAMAGES FOR BREACH OF ANY WARRANTY ON THE PRODUCTS. Products which are replaced by Electro Plastics in accordance with the foregoing shall become the property of Electro Plastics and shall be returned to it by the purchaser f.o.b. point of shipment. The maximum liability of this warranty is limited to the replacement or repair or purchase price of the defective unit. If a unit is returned and found that no defect exists, or that the user misused the unit, Electro Plastics will inform the user. If the user chooses to have the unit repaired (if possible), labor and shipping charges will apply.

Limitation of Liability
ELECTRO PLASTICS SHALL NOT BE LIABLE FOR ANY LOSS, CLAIM, EXPENSE OR DAMAGE CAUSED BY, CONTRIBUTED TO OR ARISING OUT OF THE ACTS OR OMISSIONS OF BUYER OR THIRD PARTIES, WHETHER NEGLIGENT OR OTHERWISE, IN NO EVENT SHALL ELECTRO PLASTICS’ LIABILITY FOR ANY CAUSE OF ACTION WHATSOEVER EXCEED THE COST OF THE PRODUCT GIVING RISE TO THE CLAIM, WHETHER BASED IN CONTRACT, WARRANTY, INDEMNITY OR TORT (INCLUDING NEGLIGENCE AND STRICT LIABILITY) OR OTHERWISE. IN NO EVENT SHALL ELECTRO PLASTICS BE LIABLE OR ANY SPECIAL, INCIDENTAL, CONSEQUENTIAL OR OTHER SUCH INDIRECT DAMAGES (INCLUDING, WITH-OUT LIMITATION, LOSS OF REVENUES, PROFITS OR OPPORTUNITIES), WHETHER ARISING OUT OF OR AS A RESULT OF BREACH OF CONTRACT, WARRANTY, TORT (INCLUDING NEGLIGENCE), STRICT LIABILITY OR OTHERWISE

PURCHASE AND PROJECT INFORMATION

Product purchased:

- Floor heating
- Snow-melt
- Roof de-icing

Purchased from

City

Elements installed in (floor heating):

- Kitchen
- Bathroom
- Basement

- Other

Elements installed under (floor heating):

- Tile / stone
- Hardwood
- Between joists
- Carpet
- Laminate
- Other

Type of project:

- New construction
- Renovation project

To activate warranty complete and return this warranty registration card with a complete checklist and layout showing element distribution to 11147 Dorsett Rd., Maryland Heights, Missouri, MO 63043-3505.
## Warranty Registration and Coverage

### Check List

**Important! To Activate Warranty**

The heating elements must be measured and checked by a certified electrician **BEFORE** being covered!

### Check List

</tr>
</tbody>
</table>

**Notes:**

1) Measure primary and secondary volts and amps at power supply terminal(s)
2) Use an amp meter to check amps at each terminal (a,b,c,d,...)
3) Send copy of completed check list, warranty registration card and layout showing element distribution as installed to:

Electro Plastics, Inc.
11147 Dorsett Road, Maryland Heights, MO 63043
Fax: 314-426-3556 or E-mail: design@warmfloor.com
TROUBLESHOOTING

If the following procedures do not solve and relieve the problems encountered, please check with our Technical Service Department.

A. POWER SUPPLY

1. Power Supply will not start:
   a) Check main switch.
   b) Check circuit breakers and re-set.
   c) Check power from main panel and to terminal box.

2. Power Supply is vibrating or noisy (humming):
   a) Check that the transformer is bolted to a solid wall or beam.
   b) Check tightness of power supply bolting to wall.
   c) If the wall is transmitting the vibration, use proper rubber spacers.

3. Power Supply cutout:
   a) Check current draw to make sure that the load is within limits noted on power supply name plate.
   b) Check line voltage conditions.
   c) Check for overloading when running in very cold temperatures.
   d) Check correct wiring according to diagram.
   e) Check wire size and length versus load.
   f) Check that connectors are tightly in place.
   g) Check if a conductive material is in direct contact with the heating elements (i.e., wire mesh, aluminum foil, etc.).

B. HEATING ELEMENTS

1. Temperature override:
   a) Check voltage from power supply and from main panel.
   b) Check functioning of power supply.
   c) Check proper power and wiring of controller

2. Insufficient temperature:
   a) Check controller setting.
   b) Check voltage on each heating panel.
   c) Measure length and compare amperage on each heating panel.
   d) Check wire size and length versus load.
   e) Check connectors on heating element, electrical box & power supply.
   f) Calculate the heat loss due to infiltration.
   g) Check thermal insulation below heating elements:
      (i) insufficient insulation value
      (ii) humid or wet insulation
      (iii) metal beam heat transfer
      (iv) air gaps between flooring layers
   h) Check insulation value of floor coverings.
